Case 19
Alex Loretti's Case 7

Signalment: calf, 2-3 months of age, mail-in case.

History: Outside calves 60-90 days of age, a few are dying from pneumonia; not responding well to DRAXXIN® (tulathromycin).

Gross Pathology: The liver was diffusely pale and had a variegated/mottled appearance on the capsular and cut surfaces characterized by light brown areas alternated with vivid red foci. The lung is firm (consolidated), dark-red, and the pleura was covered by abundant fibrin.
